                                                                                                                                                      gene expression - by amplification of mRNA followed
                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mRNA followed

                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7578) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The fusion gene is inserted into a region of a vaccinia virus not essential to its propagation, to give a recombinant vaccinia virus vector which is used to transform a host cell (such as HeLa, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon
                                                                                                                                    턍
                                               Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hypervariable region; ENV protein; vaccinia virus; gag gene; retrovirus; vaccines; infection; protection; primer; ss.
                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate c double-stranded cDNAs by using an aggregate of mRNAs and a plural type c labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) the double-stranded cDNAs with restriction enzyme and; (c) method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant vaccinia virus containing fusion HIB gag gene - for production in host cells of gag protein for use as vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a method for analysing a nucleic acid strand to determine the degree of complementarity between two sequences. This involves the measurement of an electric current along the annealed strands compared to a standard. This is useful in the analysis of genetic polymorphisms and variation between genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining complementarity of nucleotide fragment for gene analysis, by comparing flow of electric current from or to electroconductive substrate through DNA fragment, with reference obtained from its complement.
culturing the host cell produces particulate structures containing the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein particles may be used in the production of vaccines for protecting against infection with retroviruses such as HIV
                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADK01309/c
```

```
This invention describes a novel method for sorting single-stranded nucleic acide by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, ceranded nucleic acids to the serial and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo)molecular filaments and binding of single curanded nucleic acids to the surface is (quasi) covalent, supramolecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (anino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible caid anilows inaging of the complete pattern of all nucleic acid soil an cell, and callows inaging of the complete pattern of all nucleic acid soil and enterior of allierences in the nucleic acid pool. Since the callows inaging matrix anilatery and passible, AbRO1281-AbRO1344 represent converses and an enterior of the method is passible, the method is passed on comparison of nucleic acid pools.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                capture probes used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21 BP; 1 A; 0 C; 1 G; 19 T; 0 U; 0 Other;

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Sxample, Page 4; 8pp; German.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then nucleic acids by isolation and hybridisation of nucleic acid pools, then capture oligonout where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region. The comprises all possible combinations of up to 10 nuclectides to allow binding of particularly locked nucleic acids. The capture agents are particularly locked nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo)molecular filaments and binding of shingle stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, surface is (auss) covalent, supramolecular, chair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible caid and allows imaging of the complete pattern of all nucleic acid pool: Since the callows inaging matrix anial differences in the nucleic acid pool: Since the callows matrix miniaturisation is possible. AbX01281-AbX01344 represent and in the method is based on comparison of the invention. capture probes used in the method of the invention.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides consists and comprises variable and non-variable regions. The capture oligonucleotides to have a 5'-invariable anchor region. The complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids. The capture of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The metrial and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo) molecular filaments and binding of surface is granded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially, in mucosal, catis and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic caids (anino, carboxylic or farty acid) inexpensive and reproducible conjete pattern of allows inaging of the complete pattern of all nucleic acid since the callows inaging of the complete pattern of all nucleic acid acid in a cell, and can lows inaging of the complete pattern of allows in the nucleic acid bools, not individual can detect very small differences in the nucleic acid pool; Since the method is based on comparison of nucleic acid pools, not individual

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then creading out, where the nucleic acids are selectively bound using capture of agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides of have a 5. invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the annor region comprises a sequence of 10-50, particularly 15-25, T residues. The agents are particularly lockof nucleic acids (LMA) and the annor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streeptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve or supplements, especially minerals, trace elements, organic cativity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional captavity is alter and mixtures. The method provides rapid, inexpensive and reproducible cacids (amino, carboxyllic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and representation of differences in pools of nucleic acids ecids or a percentals.
                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root; blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rattus sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADK01328;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 71
```

```
This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture cagnits that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comparises anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises are particular sorts of single stranded nucleic acids. The capture capture of sequence of 10-50, particularly 15-25, T residues. The capture of comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, caranic, glass, cinteracting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (bysical, stimulated by an electrical filaments and binding of single compariation is used (i) for analysis of patterns, especially in mucosal, capture root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food
                                                                                                                                                                                                                        ö

allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent

additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. Example; Page 4; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region. The complement of which is present at least once in each nucleic acid and a3 'variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular,

physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, activity of blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals analyor nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible, ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example, Page 6; 8pp, German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides

have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 indicatides to allow binding of particularly locked nucleic acids (LNA) and the anchor region agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, Tresidues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the certivity of pharmaceuticals and/or nutritional compounds, esg food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acid pool; since the method is based on comparison of nucleic acid pool; since the method is based on comparison of nucleic acid pool; since the method is based on comparison of nucleic acid pool; since the capture probes used in the method of the invention. 8888888888888888888888888888888**8**

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

Thus invention describes a novel method for sorting single-stranded controlled acids by isolation and hybridisation of nucleic acids pools, then reading out, where the nucleic acids are selectively bound using capture agence that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agence are particularly locked nucleic acids (LIAA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are bictinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, ceramic, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (b) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular, physical, sused (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic cardis (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible candetect very small differences in the nucleic acids from cells, and can lower matrix, miniaturiar, in a call nucleic acid bools, since the complete pattern of all nucleic acid soil on the individual and can detect very small differences in the nucleic acid coid doil or eacid soil on the individual and can detect very small differ method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent invention describes a novel method for sorting single-stranded capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded cucles acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture cadding out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region. The capture oligonucleotides comprises all possible combinations of up to 10 nucleotides to hat comprises all possible combinations of up to 10 nucleotides to allow binding of particular sortes of single stranded nucleic acids. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic glass, comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular flaments and binding of shingle cranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical fidal or through a molecular, physical, stimulated by an electrical fidal or through a molecular side activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, or for acids (anino, carboxylic or fatty acid) or through a molecular or activity of pharmaceuticals and/or nutritional compounds, e.g. food acids (anino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and repreducible cand sind can detect very small differences in the nucleic acids from cells, and can detect very small differences in the nucleic acid pool, and capture probes used in the method of the invention.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region, the complement of which is present at least once in each nucleic acid and a3 'variable, discriminatory region that comprises all possible combinations of up to 10 nucleocides to allow binding of particular sorts of single stranded nucleic acids. The capture or particularly locked nucleic acids (INA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture or particularly locked nucleic acids (INA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture or sequence of 10-50, particularly 15-25, T residues the capture conducting properties and especially in the form of a chip. Its surface interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, es, of food acids (amino, carboxylic or fatty acid) or though a plants of captures. The method provides rapid, inexpensive and reproducible representation of differences in pools of mucleic acid being acid in a cell, and enthod is based on compatison of nucleic acid pools, not individual genes, matrix miniaturisation is the method of the invention.
                                                                                                                                                                                                                                                                                                                            Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable

(DEGS ) DEGUSSA BIOACTIVES GMBH. 28-FEB-2002; 2002DE-01008794. 28-FEB-2002; 2002DE-01008794 3oekenkamp D, Dieck HT, WPI; 2003-714082/68. DE10208794-A1 04-SEP-2003. Rattus sp. 

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture careading out, where the nucleic acids are selectively bound using capture careading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region. The complement of which is present at least once in each nucleic acid and a 3-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (in nucleotides to allow binding of particularly locked nucleic acids (in(A)) and the anothor region comprises a sequence of 10-50, particularity is-25. T residues. The agents are particularly locked nucleic acids (in(A)) and the anothor region comprises a sequence of 10-50, particularity is-25. T residues. The method is properties and especially in the form of a chip. Its surface is particularly a layer of (blo) molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo) molecular filaments and binding of single conducting propertical field or through a molecular, physical, stimulated by an electrical field or through a molecular, computed by an electrical field or through a molecular, content root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic cailes (amino, carboxylic or fatty acid) or their derivatives, salts and cailows inaging of the complete pattern of all nucleic acid fool. Since the anlows inaging in the complete pattern of all nucleic acid pool. Since the cannot and an analysis of the complete pattern of acid pool. Since the cannot and in the mucleic acid pool. Since the capture and i Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable capture probes used in the method of the invention. Example; Page 6; 8pp; German. and constant regions.

The invention relates to a complex (CI) comprising a first and second single stranded nucleic acid or its derivative and a metal ion, where the first and second base of the strands forms a bond with metal ion. Also included are detecting the existence of thymine-thymine, cytosine.

Cytosine or cytosine-thymine base pair in a DNA or its analog (involving melting DNA or its analog in an aqueous medium, processing the solution of an acmoniations of Hg(II)2+ and Ag+ in the prepared DNA solutions, and comparing the characteristics of the solution, where change in characteristics of the solution, where change in characteristics of T.T. base pair, comparing the existence of T.T. base pair, comparing a metal ion (comprising one or more DNA molecules or their analogs having a metal binding region, where the coupling of metal ion is detected by analyzing the characteristic change in DNA). The complex (CI) is useful as a non-watson Crick base pair metal complex (CI) is useful as a non-watson Crick base pair in a double stranded DNA. The propales to detecting non-watson Crick base pair in a double stranded DNA. The propales to detect non-watson Crick base pair in a double stranded DNA. The propales of characteristic change in a double stranded DNA. The prepared DNA. The DN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a complex (CI) comprising a first and second single stranded nucleic acid or its derivative and a metal ion, where the first and second base of the strands forms a bond with metal ion. Also included are detecting the existence of thymine-thymine, cytosine.

Cytosine or cytosine-thymine base pair in a DNA or its analog (involving melting DNA or its analog in an aqueous medium, processing the solution.

CC 3 minutes, to obtain three DNA solutions, dissolving Hg(II)2+, Ag+ and combinations of Hg(II)2+ and Ag+ in the prepared DNA solutions, and comparing the characteristics of the solution, where change in characteristics in Hg(II)2+, Ag+ and combinations of Hg(II)2+ and Ag+ represents the existence of T-T base pair in the respective DNA solutions) and an agent (AI) for detecting a metal ion (comprising one or more DNA molecules or their analogs having a metal binding region, where the coupling of metal ion is detected by analyzing the characteristic change in DNA). The complex (CI) is useful as anon-watson Crick base pair in a double stranded DNA. The complex (CI) enables to detect non-Watson Crick base pair in a double stranded DNA. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

New isolated protein complex having a first protein interacting with a second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma

Disclosure, Fig 62, 198pp, English.

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method for selecting modulators of the protein complex; a method of selecting modulators of an interaction between a first protein and a second protein; and the treating and/or preventing of diseases and disorders associated

ö assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders associated with the protein complexes. The diseases and disorders include cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsis, osteoporosis, obesity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an siRNA oligo which targets the transcript of a protein forming part of a protein-protein complex of the invention. with the protein complexes. The protein complexes are useful in screening Gaps ö 0.7%; Score 19.4; DB 1; Length 21; 76.2%; Pred. Nucleic acid assay methods - based on restriction fragment length determination.

Example 1; Page 7; 21pp; English.

The present sequence is a DNA probe used in a novel method of analysis or assay for nucleotides, which comprises: (i) digesting DNA with a castriction enzyme; (ii) discriminating a difference in sequences of the DNA fragments obtained around the 3' termini with a DNA probe and extending the DNA probe by a complementary strand synthesis to fractionate the DNA fragments into groups, and (iii) measuring lengths of the DNA fragments which belong to the groups, or length of the extended DNA probe, and using the lengths obtained for the fragments around the 3' termini as fingerprints. Where polyA is present, the presence of recognition sequence GCG is critical for clarifying the terminal site, this is because the length of polyA cannot be controlled. The method is useful for assaying long DNA sequences

The present invention relates to the isolation of polypeptide-laminin B210.67, and the polymucleotide encoding it. Also described is the process for preparing the protein by DNA recombination. The polypeptide is useful for treating diseases such as embryo development tratogenesis. The present sequence for reverse transcriptuse (RT)-PCR primer #1 is used with RT-PCR primer #2 (ABK12410) for isolating cDNA encoding polypeptide-laminin B210.67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptide-laminin B210.67, useful for treating diseases such as embryo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polymucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelectused in a hybridisation assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inable to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curature sequences of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to a method for determining if a gene product or compound is involved in preventing replication error in a cell. The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of a marker gene in the cell, where the expression level of the marker gene is dependent on the occurrence of a replication error. The invention is useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Caenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                      Determining if a gene product/compound is involved in preventing replication error in a cell, useful for treating cancer, comprises determining expression level of a marker gene in a cell treated with a gene product inhibitor/compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.7%; Score 19.4; DB 1; Length 24; 87.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for determining whether a product of a gene is involved in preventing a replication error in a cell. The method comprises providing the cell with a specific inhibitor for the product and determining the level of functional expression of a marker gene in the cell, where the level of expression of the marker gene is dependent on the occurrence of the replication error. The method is used for determining whether a product of a gene is involved in preventing a replication error in a cell. The identified genes are useful for developing diagnostic tools, or as targets for drug development to manipulate cells on the basis of the presence or absence of function of the gene. ABZ2335-36 represents fragments of plasmids used to detect somatic instability, in the course of the invention

The present sequence is that of pyrene-anchored locked nucleic acid (LNA) coligo(dT) primer ON12, which was used in first-strand cDNA synthesis from enkaryotic mRNA. It includes compound '17d' at its 3' end, which is based on an LNA-type 2'-0,4'-C-methylene-beta-D-ribofuranosyl moiety. It is one of a set of such primers (see also ACC48483-85) that were used in an example from the invention to demonstrate improved reverse transcription of mRNA using pyrene-LNA anchored oligo(T) primers. The following results were observed: efficient priming on mRNAs with short poly(A) tails; efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T units resulting in an improved T20-VN anchor primer and thus avoiding reverse transcription of long poly(A) tracts; and improved reverse transcription of eukaryotic poly(A) tracts; and improved reverse that comprise unique base groups. Desirable nucleobase and nucleosidic that comprise unique base groups. Desirable nucleobase and nucleosidic into nucleic acid strands. The novel LNA compounds can be used e.g. as come in diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid comprising a locked nucleic acid unit having a modified base that comprises an optionally substituted carbocyclic aryl moiety, or modified nucleobase or nucleosidic base other than

The method comprises: (1) performing a first PCR in a PCR mixture; (2) performing a second PCR in a PCR mixture; (2) performing a second PCR in a PCR mixture; (3) performing a second PCR in a PCR mixture; and (3) quantifying the number of copies of the second target nucleic acid molecule. Also described: (1) quantifying the copy number of a group of target nucleic acids in a sample; and (2) determining whether a subject is at risk of acquiring Alzheimer's disease. The method is nucleic acid molecules present in a sample for determining whether a nucleic acid molecules present in a sample for determining whether a subject is at risk of acquiring Alzheimer's disease. ACC99620 to ACC99730 represent PCR primer used in the exemplification of the present invention

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or stabhylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a the control of the present and to activate immune cells. Note: the

                                                                                                                                                                                                                                                                                                                  administering at least one antitanglogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumaroid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myccardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                     Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                       comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oncogene, tra oncogene 10.56, human; treatment; gene therapy; cytosta; haemostatic; virucide; immunomodulatory; antiinflammatory; diagnosis; malignant tumour; haemopathy; human immunodeficiency virus; HIV infection; immunological disease; inflammation; PCR primer; ss.

Also described is the process for preparing the protein by DNA recombination and the application of the polypeptide and polynucleotide in treating various diseases such as malignant neoplasms, haematopathy, human immunodeficiency virus (HIV) infection, immunological diseases, and
                                                                                                                                          This invention describes a novel human tre oncogene 10.56 which has cytostatic, haemostatic, virucide, immunomodulatory and antiinflammatory activity and can be used for gene therapy. The polypeptide of the invention and its encoding polynucleotide are used in diagnosis and treatment of malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. Sequence represents an RT-PCR primer used in the amplification of the human tre oncogene 10.56 gene which is described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human transcriptional activation subunit 14 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and
                            human tre oncogene 10.56 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; transcriptional activation subunit 14; malignant neoplasm; haematopathy; cytostatic; HIV infection; human immunodeficiency virus; immunological disease; inflammation; virucide; immunomodulatory; antiinflammatory; reverse transcriptase-PCR; RT-PCR; primer; ss.

                                                                                                                                                                                                                                                             ö
various inflammations. Antagonists against the polypeptide can also be used in treating such diseases. The present sequence for reverse transcriptase (RT)-PCR primer #2 is used with RT-PCR primer #1 (ABK13714) for isolating cDNA encoding human transcriptional activation subunit 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimilatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psortasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             eczema,

The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; non-CpG; immunostimulatory; non-palindromic; immune response; proliferation; differentiation; cytokine; antibody production; B-cell; plasmacytoid dendritic cell; immunomodulator; gene therapy; chronic myelogenous leukaemia; melanoma; Kaposi's sarcoma; renal cell carcinoma.

                                                                                                                                                                                                                                                          This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA coligonucleotides (without a CPG motif), which can stimulate an immune cresponse in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or charapy for inducing B-cell activation, treating, preventing or anneliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG variant DNA oligo, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA cligonucleotides (without a CpG motif), which can stimulate an immune cresponse in animals of the order of primate, including humans. The immune cresponse is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present cinvention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell continum and this oligonucleotide sequence is an immunostimulatory non-CpG variant DNA oligo incare asserved.
                                                                                                                                                                                                   New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; non-CpG; immunostimulatory; non-palindromic; immune response; proliferation; differentiation; cytokine; antibody production; B-cell; plasmacytoid dendritic cell; immunomodulator; gene therapy; chronic myelogenous leukaemia; melanoma; Kaposi's sarcoma; renal cell carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. Claim 14; SEQ ID NO 24; 139pp; English melanoma

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CPG motif.) which can stimulate an immunne response in animals of the order of primate, including humans. The immune and antibody production in Be-ealls, as well as cell differentiation, cytokine cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an entigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or cells and sylocolipids. As used in activation, treating, preventing or therapy for inducing B-cell activation, treating preventing or calls and elogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG variant DNA oligo, used in an exemplification of the invention.

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma

Claim 14; SEQ ID NO 26; 139pp; English

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CPG motif.) which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, virtues, bacteria, parasites, tumour cells and glycoligids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi, sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG variant DNA oligo, used in an exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune antibudo production in B-cells, as well as cell differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG variant DNA oligo, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.

This invention relates to novel immunostimulatory oligonuclectides that contain a non-palindromic sequence motif. Specifically, it refers to DNA coligonuclectides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine production in B-cells, as well as cell differentiation and antibody production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory phosphorothioate non-cpG variant DNA oligo, used to determine the effect of converse on a converse on an immunostimulatory converse on a converse on an immunostimulatory converse on a conve

Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in B-cells, as well as cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.
chronic myelogenous leukaemia; melanoma; Kaposi's sarcoma; renal cell carcinoma.
                                                                                                                                                                                                                                                                                                                                                                    Claim 14; SEQ ID NO 23; 139pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune artibody production in B-cells, as well as cell differentiation, cytokine antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an invention describes immunomodulator compositions that also comprise an categor selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or mellorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunatory non-CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                 New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif.) which can stimulate an immunne response in animals of the order of primate, including humans. The immune cresponse is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present cinvention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ampliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell correction and an immunostimulatory non-CpG variant DNA olice assets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene typing; polymorphic microsatellite loci; PML; disease predisposition; microsatellite marker; prion disease; cystic fibrosis; malignant hyperthermia syndrome; metabolic disease; milk protein; hormone; transcription factor; pT7-blue-vector; cow;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             variant DNA oligo, used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.7%; Score 19.2; DB 1; Length 24; 87.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and determining the length of the resulting amplicon(8). Also described are: method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases. especially prion diseases. Cut also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, metabolic diseases; also to type genes that encode milk proteins, metabolic diseases; also to type genes that encode milk proteins, particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion comparising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                 Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining

The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and cast eremining the length of the resulting amplicon(8). Also described are: The method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or compare PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases, especially prion diseases to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, cometabolic diseases; also to type genes that encode milk proteins, cometabolic diseases, also to type genes that encode milk proteins, particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion cycle protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                           Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                             Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunostimulant; Antiinflammatory; Antipsoriatic; Gastrointestinal-Gen.; Antiulcer; Dermatological; Antiallergic; helper T-lymphocyte; mimune stimulation; inflammation; psoriasis; inflammatory bowel disease; crohns disease; ulcerative colitis; eczema; skin allergy; contact dermatitis; ss; phosphorothioate.

The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating nonallergic inflammatory diseases such as psoriasis, inflammatory bowel diseases and ulcertive colitis), eczema, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reverse transcription primer used in cDNA analysis technique.

The invention relates to aminooxy-modified(oligo)nucleotides or nucleosides which are useful as therapeutics, diagnostics, and research reagents. They may be used, e.g., for modulation of the ras gene and may be able to modulate the process of transformation from normal to malignant cell growth. They may be prepared using known methods. Inclusion of the aminooxy moleties can improve binding of oligonucleotides to complementary strands. The moieties can also provide conjugation sites useful for conjugation of useful ligands (e.g. reporter groups and groups for modifying uptake, distribution or other pharmacodynamic properties) to oligonucleotides. The present sequence in prepagents an example of an aminooxy-modified oligonucleotide disclosed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New aminooxy-modified oligonucleotides - which can show improved binding to complementary strands and improved resistance to nuclease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAT10742-67 are synthetic oligonucleotides which device (ED) of the invention of the electronically self-addressable device (ED) of the invention. The ED comprises a substrate, an electrode or opt. a number of electrodes supported by the substrate, a current square operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecule. The ED is used for genetic typing and comprises a number of electronically addressable locations each comprising an electrode, and a binding entity, such as one of these probes, attached to each of the locations capable of a genetic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Electronically self-addressable device - used for electronic control of, e.g. nucleic acid hybridisation.

The specification describes a self-addressable, self-assembling microelectronic device which is designed to actively carry out and control multi-step and multiplex molecular biological reactions in microscopic formate. A key aspect of this inventions is played by the ion microscopic formate. A key aspect of this inventions is played by the ion permeable permeation layer which overlies the electrode. This permeation layer which overlies the electrode. This permeation control reaction but also separates the attached oligonucleocides and hybridized tometic mediately at the electrode surface. The microelectronic device is immediately at the electrode surface. The microelectronic device is mediately at the electrode surface. The microelectronic device is as nucleic acid hybridizations, antibody/antigen reactions, sample preparation, diagnostics and biopolymer synthesis. The device can electronically control the transport and attachment of specific microcof locations. The device can subsequently control the transport and reaction of analytes or reactants at the addressed specific micro-locations. The device can subsequently control the transport and reaction of analytes or reactants at the addressed specific micro-locations of evice is able to concentrate analytes and reactants, remove nonceptically bound molecules, provide stringency control for DNA bybridization reactions and improve the detection of analytes. The present sequence represents a probe used to exemplify the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzyme-specific cleavable polynucleotide substrate;

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynuclectide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nuclectide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligomeric compound; 2'-O-modified ribosyl nucleoside; 3' endo geometry; nuclease resistance; phosphodiester; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes an enzyme-specific cleavable polynucleotide substrate bearing quenched fluorescent moieties. The enzyme-specific cleavable polynucleotide substrate is useful in biological assays for detection and identification of microorganisms, sterilization assurance, pharmaceutical discovery, enzyme assays, immunoassays and other biological assays. The method provides a rapid and convenient approach for detection and identification of microorganisms. It can be adapted to sequence-dependent or sequence-independent tests. The invention provides improved accuracy, faster detection, and overall lower cost in detection and identification of microorganisms. The presence of nuclease is measured more accurately and sensitively by red-shifting the emission the electromagnetic spectrum and reducing the effect of background signal levels of intact reagents. The present sequence is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen; PSA; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                  The present sequence represents an uniform phosphodiester oligonucleotide. The specification describes oligomeric compounds containing 2.0-modified ribosyl nucleosides. The 2'-O-modified nucleosides include ring structures that position the sugar molety of the nucleosides preferentially in 3' endo geometries. The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic, therapeutic and research reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= b

```
The present invention is concerned with methods of determining the nuclease stability of oligomeric compounds using capillary-gel electrophoresis and laser-induced fluorescence. The methods are useful in the polymerase chain reaction (PCR), molecular cloning and disease diagnosis and treatment. The present sequence was used in a demonstration of the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                   The present sequence represents an oligomeric compound containing 2'-0-modified ribosyl nucleosides. The oligomeric compound contains phosphodiester linkages. The 2'-0-modified nucleosides include ring structures that position the sugar moiety of the nucleosides preferentially in 3' endo geomeries. The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic, therapeutic and research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining the nuclease stability and relative binding affinity of an oligomeric compound comprises capillary gel electrophoresis using laser-induced fluorescence.
                                                       Novel 2'-O-aminoethyloxyethyl modified nucleosides and oligonucleotides used in diagnostic, therapeutic and research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T19 diester; nuclease stability assay; polymerase chain reaction; PCR; molecular cloning; disease diagnosis; disease treatment; ss.

The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least I nucleotide is linked to adjacent nucleotide by a 2',5'-internucleotide linkage and bears a 3'-substituent. The oligonucleotides can be used in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research reagents

```
This sequence represents a modified oligonucleotide used in the course of the invention. The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a 2',5'- internucleotide linkage and bears a 3'-substituent. The oligonucleotides can be used in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

                                                                                                                                                                                                             Key
The invention relates to aminooxy-modified nucleosides and oligonucleotides and to oligonucleotides that elicit RNase H for cleavage in a complementary nucleic acid strand. It also relates to oligonucleotides wherein at least some of the nucleotides are functionalised to be nucleas resistant, at least some of the nucleotides are include a substituent that potentiates hybridisation of the coligonucleotide to a complementary strand, and at least some of the nucleotides include a 2'deoxy-erythro-pentofuranosyl sugar moiety. The nucleotides include a 2'deoxy-erythro-pentofuranosyl sugar moiety. The provides for improved binding of such oligonucleotides to a complementary strand. The oligonucleotides of the invention are used as diagnostic, therapeutic or research reagents, and can be used to modulate gene cypression in organisms. The oligonucleotides containing the modified nucleosides have increased nuclease resistance and increased binding affinity to a complementary strand. The present sequence represents an oligonucleotide containing nucleotides substituted with a 2'-O-{2- [N-(2- amino)ethyl-N-(methyl)]aminooxyethyl} group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Aminooxy-modified nucleosides and oligonucleotides useful in diagnostic, therapeutic and research reagents and for modulating the expression of

Oligonuclectide ISIS 22115 contains a mixed phosphodiester and phosphorothioate backbone and has 2'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venome phosphodiesterase and liver homogenate on the stability of and liver homogenate on the stability of and B-form conformational geometry. The A-form geometry and outless the binding affinity and nuclease resistance of the oligonuclectide. The B-form geometry allows the oligonuclectide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonuclectides can be used to treat psoriasis and other inflammatory skin conditions, skin clancers and viral, bacterial and fungal infections, and in various
                                                                                                                                                       to
                                                                                                                                           New oligonuclectides containing sequences with A and B geometry, used treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 19; DB 1; Length 19;

The nucleotides were used to examine the effects of the modifications on nuclease resistance. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory

the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications

                                                                                                                                                                                                     Oligonucleotide ISIS 22113 contains a phosphorothioate backbone and has 2'-0-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invantion have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                               phosphorothioate backbone and has 3'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonuclectides. Novel oligonucleotides of the invention have both A-and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various

It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonuclectides. Novel oligonuclectides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonuclectide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonuclectides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,

This invention describes a novel synthetic method (M) comprising: (a) providing a sample comprising a number of oligomers of formula (1); (b) contacting the sample with a deprotecting agent to remove R t groups from the oligomers; and (c) reacting the oligomer with a cleaving reagent. The method is used to produce oligomeric compounds for use in antisense and oligonucleotide therapies. The method enables the synthesis of oligomers with a reduction in the number acrylonitrile groups attached.

Acrylonitrile has been demonstrated to be a potent carcinogen in rats. This sequence represents a phosphorothioate 20-mer primer which is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cleavage of nucleic acids from solid supports assay oligonucleotide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detaching nucleic acid molecule comprising unconventional nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonuclectide ISIS 22111 contains a phosphodiester backbone and has 2'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonuclectides. Novel oligonuclectides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonuclectide. The B-form geometry allows the oligonuclectide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonuclectides can be used to treat psoriasis and other inflammatory skin conditions skin cancers and viral, bacterial and fungal infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to nucleotide oligomers comprising monomer units. Oligomers modulate gene expression when hybridized by a single- or double-stranded nucleic acid. They are useful for gene therapy, diagnostic and investigative purposes
                                                                                   The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Guanidinium functionalized oligomers prepared from corresponding monomer units, are hybridizable with a specific RNA or DNA sequence, useful for diagnostic and therapeutic purposes.
                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                           .

New oligomers for use as research reagent, for treating disease caused by undesired production of proteins, and for diagnosing and treating AIDS, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to C3' methylene hydrogen phosphate oligomers. The oligomers may be used as research reagents, for treating disease caused by undesired production of proteins and for diagnosing and treating AIDS and atherosclerosis

                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in a acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain enzymes which recognise nucleic acids
                                                                                                                                                                                                                                                                 Preparing sulfurized 2' substituted phosphorothioate oligonucleotides useful in biological research, comprises phosphitylating the 5'-hydroxyl of a nucleic acid having a nucleoside with a 2' modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

                                                                                                                                                                                                                               The present invention provides a number of DNA-RNA oligonucleotides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, RNase H type II, RNase H1 cleavage substrate; antisense therapy;
gene therapy; primer; phosphorothioate backbone; ss.
                                                                                                                                                                  Chimeric oligonucleotides that can serve as substrates for human RNase H1, useful for enhancing the effectiveness of antisense gene therapies.

can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention
                                                                                                                                     The present invention provides a number of DNA-RNA oligonucleotides which
                                                                            Chimeric oligonucleotides that can serve as substrates for human RNase {\rm HI}_{\rm c} useful for enhancing the effectiveness of antisense gene therapies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New 2'-O-acetamido modified nucleosides (I) used to produce oligonucleotides which have enhanced nuclease resistance and superior hybridization properties than prior art.
                                                                                                                                                                                                                               Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 U; 0 Other;

```
modified nucleosides were used to produce oligonaclectides which have enhanced nucleosides were used to produce oligonaclectides which have enhanced nucleosides were used to produce oligonation properties than prior art. The oligomeric compounds are useful for identification or quantification of ribonacleic acid and deoxyribonacleic acid or for modulating the activity of an ribonacleic acid or deoxyribonacleic acid modulating the activity of an ribonacleic acid or deoxyribonacleic acid molecule. They have a modified nucleoside monomer and are specifically hybridisable with a preselected nucleotide sequence of a single-stranded or double-stranded target deoxyribonacleic acid or ribonacleic acid molecule. The oligomers are further useful in a ras-luciferase fusion system using ras-luciferase transactivation. They are useful in abnormal cell proliferation and tumour formation and modulation of expression of protein kinase C and cell adhesion molecules such as ICAM. They are useful in the modulation of proteins related to multidrug resistance and curral genomic nucleic acids such as HOV, herpes viruses, Epstein-Barr virus, cytomegalovirus, papillomavirus, hepatitis C virus and influenza
present sequence is a modified oligonucleotide. 2'-0-acetamido-

quantitative detection of targets in a sample by molecular interaction between the target and probes in an array. The method can be used to detect interactions between nucleic acids, antigens and antibodies or receptor and ligands, particularly in applications such as medical diagnosis, forenatic schence, bacterial screening, tissue typing for transplantation, monitoring gene expression, and genetying. The present sequence is a modifying oligonucleotide used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                     2'-0-alkyl oligonucleotide; nuclease resistance; diagnosis; therapy; ss.

```

'n

The present sequence is that of a chimeric oligonucleotide having some

```
cc with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951)

with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951)

cc with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951)

cc revealed the nuclease resistance of the modified oligomers. The invention of provides methods for the alkylation of alcohols, amines, thiols and their cc derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-balkyl cc the alkylation of the 2', 3' or 5'-balkyl culfate modified compounds are disclosed. Displacement of the 2', 3' or 5'-O-alkyl cc sulfate with a nucleophile provides 2', 3' or 5'-O-modified compounds are disclosed. Displacement of the 2', 3' or 5'-O-alkyl nucleosides and nucleosides and nucleoside cc the preparation of 2'-O-alkyl nucleosides, nucleosides and nucleoside cc surrogates that are precursors for the preparation of oligomeric compounds useful as therapeutics, diagnostics and research reagents

The present sequence is that of a chimeric compared with clienthylaminopropyl modifications. This was compared with coligonucleotides with methyl thioethyl (see ABA91949) and methoxyethoxy (see ABA91949) and methoxyethoxy (see ABA91949) and modifications for resistance to snake venom phosphodiesterase. The assay revealed the muclease resistance of the action of modified oligomers. The invention provides methods for the alkylation of aloohols, amines, thiols and their derivatives by cyclic sulfate controls, amines, thiols and their derivatives by cyclic sulfate in the compounds and their mediates. In particular, methods for the alkylation of the 2', 3' or 5'-0-alkyl sulfate modified compounds are strongers to farso of the 2', 3' or 5'-0-alkyl sulfate with a nucleophile provides 2', 3' or 5'-0-alkyl sulfate with a nucleophile provides 2', 3' or 5'-0-alkyl for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric compounds useful as therapeutics, diagnostics and research reagents
                                                                                       present sequence is that of a chimeric oligonucleotide having some 2'
nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2'-0-alkyl oligonucleotide; nuclease resistance; diagnosis; therapy; ss.

The present sequence is that of a chimeric oligonucleotide having some 2'—methoxyethoxy modifications. This was compared with oligonucleotides with methyl thioethyl (see ABA91949) and dimethyl aminopropyl (see ABA91951) modifications for resistance to snake venom phosphodisterase. The always revealed the nuclease resistance of the modified oligomers. The invention provides methods for the alkylation of alcohols, amines, thiols and their derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of concleosides and their analogues with cyclic sulfates to form the 2', 3' or 5'-o-alkyl sulfate modified compounds are disclosed. Displacement of the 2', 3' or 5'-o-alkyl sulfate with a nucleophile provides 2', 3' or 5'-o-alkyl sulfate with an ancleophile provides 2', 3' or 5'-o-alkyl sulfate with an ancleophile provides 2', 3' or 5'-o-alkyl sulfate with a nucleophile provides are especially useful for the preparation of 2'-o-alkyl nucleotides, nucleosides and their analogues. The methods are especially useful for the preparation of 2'-o-alkyl nucleosides surrogates that are precursors for the preparation of 2'-o-alkyl nucleosides and research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                   Alkylation of alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tailing reaction related exemplary primer biotin-dT18U SEQ ID NO:1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tailing reaction, tailed primer, primer, probe, identification, detection, linear amplification scheme, chain extending enzyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                    The present invention describes a method for detecting a nucleic acid probe, which comprises using chain extending enzymes to elongate probes. The method comprises (a) treating the sample with a chain cerminating the sample with a chain necrminating the sample (b) contacting the sample with the probe containing a terminus capable of elongation by a chain extending enzyme, where the probe hybridises to the nucleic acid in the sample; (c) contacting the sample with a chain extending enzyme and its substrates, which elongates the probe; and (d) detecting the elongated hybridised probe. Also described is a method comprising; (a) treating nucleic acid molecules or modified nucleic acid in a sample with a reagent or reagents that render the nucleic acid sin a sample with a nucleic acid probe that includes an extendable terminus, under conditions where hybrids form; and (c) treating any hybrids formed with a non-template dependent chain elongating enzyme and its substrates, where any hybridised probe is extended. The method is useful for identifying and detecting nucleic acids, particularly DNA hybridisation probes. The present sequence the acids, particularly DNA hybridisation probes. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                       Identifying and detecting nucleic acids, particularly DNA hybridization probes, involves employing chain extending enzymes (e.g. telomerase) to elongate probes to render them readily detectable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dihydroxy sugar moiety; 2'-O-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-o-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridiastion affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity; nuclear resistance, alkylation, therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide #5 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prakash TP;

                                                                                                                                                 The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dihydroxy sugar moiety; 2'-0-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.
